Persistent lateral error of the car's position against the map (metres; heading error about 0.1 radian per metre)
Model (dashed = map is the only lane cue; solid = has a second cue)
Proposed model (trained without position error)
Trained with random position error; map is the only lane cue
Same, and told the size of the position error
Trained with position error + a second noisy lane cue
Same, and told the size of both errors
